On Apr 22, 2001 this sequence version replaced gi:9798432.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats: all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em. EMBL; Sw.;
SMISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP
database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               http://www.sanger.ac.uk/Projects/C_elegans/wormpep LA16-35H7 is part of a clone contig from the tip of the short arm of chromosome 16 spanning 2Mb of pl3.3 (Higgs D.R., Flint J., Daniels R., MRC Molecular Haematology Unit, Institute of Molecular Medicine, Oxford (unpublished)), and is from the Los Alamos, flow sorted human Chromosome 16 libraries constructed by Norman Dogett (unpublished). VECTOR: SCOS-1 (unpublished). VECTOR: SCOS-1 IMPORTANT: This sequence is not the entire insert of clone LA16-335H7 it may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true left end of clone LA16-32ID2 is at 37208 in this sequence. The true right end of clone LA16-32ID2 is at 5146 in this sequence. The

NOTE: This is a 'working draft' sequence. It currently consists of 24 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary, Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              as soon as it is available and the accession number be preserved.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

A claimed method for the specifically delivering an effector molecule to a tumour cell bearing an antigen comprising at least 10 contiguous amino acids of mesothelin involves: (a) providing a chimeric molecule comprising the effector molecule statched to a targeting molecule that specifically binds to mesothelin; and (b) contacting the tumour with the chimeric molecule such that the chimeric molecule specifically binds to a tumour cell. Also claimed is a method for inhibiting composition or activity by contacting mesothelin bearing cells with inhibitory nucleic acids for the mesothelin gene. The composition of the mesothelin contacting mesothelin contacting mesothelin contacting mesothelin of consolutions or ovarian tumours. DNA encoding the mesothelin contacting useful in cancer treatment. Antisense
